Monticello August 13. 12.

Your letter of Aug. 3. asking information on the subject of Mr. Oliver Evans's exclusive right to the use of what he calls his Elevators, Conveyors, and Hopper-boys, has been duly received. my wish to see new inventions encouraged, and old ones brought again into useful notice, has made me regret the circumstances which have followed the expiration of his first patent. I did not expect the retrospection which has been given to the reviving law. for altho' the 2<sup>d</sup> Proviso seemed not so clear as it ought to have been, yet it appeared susceptible of a just construction; and the retrospective one being contrary to natural right, it was understood to be a rule of law that where the words of a statute admit of two constructions, the one just and the other unjust, the former is to be given them. The 1<sup>st</sup> Proviso takes care of those who had lawfully used Evans's improvements under the 1<sup>st</sup> patent; the 2<sup>d</sup> was meant for those who had lawfully erected and used them after that patent expired, declaring they "should not be liable to damages therefor." These words may indeed be restrained to uses already past; but as there is parity of reason for those to come, there should be parity of law. every man should be protected in his lawful acts, and be certain that no ex post facto law shall punish or endamage him for them. but he is endamaged, if forbidden to use a machine lawfully erected, at considerable expence, unless he will pay a new and unexpected price for it. The proviso says inserted pro majori cautela only. that he who reected and used lawfully shall not be liable to pay damages. but if the proviso had been omitted, would not the law, construed by natural equity, have said the same thing. in truth both Provisos are useless, and shall useless provisos, authorise inferences against justice? the sentiment that ex post facto laws are against natural right is so strong in the United States, that few, if any, of the State constitutions have failed to proscribe them. the federal constitution indeed interdicts

35366

Mr. Isaac MPherson

them in criminal cases only; but they are equally unjust in civil as in criminal cases and the omission of a caution which would have been right, does not justify the doing what is wrong. nor ought it to be presumed that the legislature meant to use a phrase in an unjustifiable sense, if by any rules of construction, it can be even strained to what is just. the law books abound with similar instances of the care, the judges take of the public integrity. laws moreover abridging the natural rights of the citizen, should be restrained by vigorous constructions within their narrowest limits.

Your letter however points to a much broader question, whether what have received from Mr Evans the new and the proper name of Elevators are of his invention. because, if they are not, his patent gives him no right to obstruct others in the use of what they possessed before. I assume it as a Lemma that it is the invention of the machine itself which is to give a patent right, and not the application of it to any particular purpose of which it is susceptible. if one person invents a knife convenient for pointing our pens, another cannot have a patent right for the same knife to point our pencils. a compass was invented for navigating the sea; another could not have a patent right for using it to survey land. a machine for threshing wheat has been invented in Scotland. a  $\$2^{\text{d}}$ . person cannot get a patent right for the same machine to thresh oats, a  $3^{\text{d}}$ . rye, a  $4^{\text{th}}$ . peas, a  $5^{\text{th}}$ . clover &c. a string of buckets is invented & used for raising water, one &c. can a  $2^{\text{d}}$ . have a patent right to the same machine for raising wheat, a  $3^{\text{d}}$ . oats a  $4^{\text{th}}$ . rye, a  $5^{\text{th}}$ . peas &c? The question then whether such a string of buckets was invented first by Mr Oliver Evans, is a mere question of fact in Mathematical history. now turning to such books only as I happen to possess, I find abundant proof that this simple machinery has been in use from time immemorial.

Dr. Shaw, who visited Egypt & the Barbary coast in the years 1727. 8. 9. in the margin of his map of Egypt, gives us the figure of what he calls a

UNIVERSITY OF  
CONCORDIA

Persian wheel, which is a string of round cups or buckets, hanging on a pulley, over which they revolve, bringing up water from a well, and delivering it into a trough above. he found this used at Cairo, in a well 264. f. deep, which the inhabitants believe to have been a work of the patriarch Joseph. Shaw's travels. 3d. Oxford edition of 1738. in folio. and the Universal history I. 416. speaking of the manner of watering the higher lands in Egypt, says "formerly they made use of Archimedes's screw, whence named the Egyptian pump; but they now generally use shells (wallowas) which carry a rope or chain of earthen pots, holding about 7. or 8. quarts apiece, and draw the water from the canals. There are besides a vast number of wells in Egypt, from which the water is drawn in the same manner to water the gardens & fruit trees; so that it is no exaggeration to say, that there are in Egypt above 200,000. oxen daily employed in this labour." Shaw's name of Persian wheel has been since given more particularly to a wheel with buckets, either fixed, or suspended on pins, at its periphery. Mortimer's husbandry T. 18. Duhamel III. 11. Ferguson's Mechanics plate XIII. but <sup>has</sup> the figure, and the verbal description of the Universal history prove that the string of buckets is meant under that name. his figure differs from Evans's construction in the circumstances of the buckets being round, and strung thro' their bottom on a chain, but it is the principle, to wit a string of buckets, which constitutes the invention, not the form of the buckets, round, square, or hexagon; nor the manner of attaching them, nor the material of the connecting band, whether chain, rope, or leather. Vitruvius L. 2. c. 9. describes this machinery as a windlass, on which is a chain descending to the water, with vessels of copper attached to it; the windlass being turned, the chain moving on it will raise the vessels which, in passing over the windlass, will empty the water they have brought up into a reservoir. and Perrault, in his edition of Vitruvius. Paris 1680. fol. Plates 61. 62. gives us three forms of these water elevators, in one of which the buckets are square, as m<sup>r</sup> Evans's are. Bossut Histoire des Mathématiques T. 86. says "the drum wheel, the wheel with buckets & the Chapelets, are hy-

hydraulic machines which come to us from the antients. but we are ignorant of  
the time when they began to be put into use? The Chapelets are the revolu-  
-ing band of buckets which Shaw calls the Persian wheel, the moderns a Chain-  
-pump, and Mr Evans Elevators. The most of my books in which I find  
these Elevators is Wolf's *Cours de Mathematiques* §. 370. & Pl. 1. Paris 1727. 8<sup>vo</sup>  
here are two forms. in one of them the buckets are square, attached to two  
chains, passing over a cylinder or wallower at top, & under another at  
bottom, by which they are made to revolve. it is a nearly exact represen-  
-tation of Evans's elevators. but a more exact one is to be seen in Des-  
-agulier's *Experim<sup>t</sup>. Philosophy* II. Plate 34. in the *Encyclopedie de*  
*Diderot et D'Alembert* 8<sup>vo</sup>. edn of Lausanne, 1<sup>st</sup> vol. of Plates, in the 4. subse-  
-cled *Hydraulique*. Nonia, is one where round earthen pots are tied  
by their collars, between two endless ropes suspended on a revolving can-  
-thern or wallower. this is said to have been used for raising ore out of  
a mine. in a book which I do not possess, "L'Architecture Hydraulique  
de Belidor, the 11<sup>th</sup> vol. of which is said [De la Lande's continuation of]  
Montucla's *Histoire des Mathematiques* [III. 711.] to contain a detail of all  
the pumps, antient and modern, hydraulic machines, fountains,  
wells &c. I have no ~~book~~ this Persian wheel, chain-pump, Chapelets  
Elevators, by whichever name you chuse to call it, will be found in va-  
-rious forms. the last book I have to quote for it is Prony's *Archi-  
-tecture Hydraulique* I. Avertissement vii. and §. 620. 649. 650.. in the  
latter of which passages he observes that their idea which occurs  
for raising water is to lift it in a bucket by hand. when the water  
lies too deep to be reached by hand, the bucket is suspended by a  
chain, and let down over a pulley or windlass. if it be desired to raise  
a continued stream of water, the simplest means which offers itself to the  
mind is to attach <sup>to</sup> an endless chain or cord a number of pots or buckets, so  
disposed that, the chain being suspended on a lantern or wallower above,

and plunged in water below, the buckets may descend and ascend alternately, filling themselves at bottom, and emptying at a certain height above, so as to give a constant stream. Some years before the date of Mr Evans's patent, a Mr Martin of Caroline county in this state, constructed a drill-plough, in which he used the band of buckets for elevating the grain from the box into the funnel, which let them down into the furrow. He had bands with different sets of buckets adapted to the size of peas, of turnips seed &c. I have used this machine for sowing Bonniseed, also, and propose to have a band of buckets for drilling Indian corn, and another for wheat. Is it possible that in doing this I shall infringe Mr Evans's patent? That I can be debarred of any use to which I might have applied my drill, when I bought it, by a patent issued after I bought it?

These verbal descriptions, applying so exactly to Mr Evans's elevators, and the drawings exhibited to the eye, flash conviction both on reason and the senses, that there is nothing new in these elevators but their being strung together on a strap of leather. If this strap of leather be an invention, entitling the inventor to a patent right, it can only extend to the strap, and the use of the string of buckets must remain free to be connected by chains, ropes, a strap of hempen girthing, or any other substance, except leather. but indeed Mr Martin had before used the strap of leather.

The Screw of Archimedes is as ancient at least, as the age of that Mathematician, who died more than 2000 years ago. Diodorus Siculus speaks of it L. I. pa. 21. and L. V. pa. 217. of Stevens's edition of 1555, and Vitruvius X. II. The cutting of its spiral worm into sections for conveying flour or grain, seems to have been an invention of Mr Evans, & to be a fair subject of a patent right, but it cannot take away from others the use of Archimedes's screw, with it's perpetual spiral, for any purposes of which it is susceptible.

35368  
The Hopper-boy is an useful machine; & as far as I know, original.

It has been pretended by some (and in England especially) that inventors have a natural and exclusive right to their inventions; & not merely for their own lives, but inheritable to their heirs. but while it is a moot question whether the origin of any kind of property is derived from nature at all, it would be singular to admit a natural, and even an hereditary right to inventions. it is agreed by those who have seriously considered the subject, that no individual has, of natural right, a separate property in an acre of land, for instance. by an universal law indeed, whatever, whether fixed or moveable, belongs to all men equally and in common, is the property, for the moment, of him who occupies it; but when he relinquishes the occupation the property goes with it. stable ownership is the gift of social law, and is given later in the progress of society. it would be curious then if an idea, the fugitive fermentation of an individual brain, could, of natural right, be claimed in exclusive and stable property. if nature has made any one thing less susceptible, than all others, of exclusive property, it is the action of thinking power called an Idea; which an individual may exclusively possess as long as he keeps it to himself; but the moment it is divulged, it forces itself into the possession of every one, and the receiver can not dispossess himself of it. its peculiar character too is ~~that~~ that no one possesses the less, because every other possesses the whole of it. he who receives an idea from me, receives instruction himself, without lessening mine; as he who lights his taper at mine, receives light without darkening me. that ideas should freely spread from one to another over the globe, for the moral and mutual instruction of man, and improvement of his condition, seems to have been peculiarly and benevolently designed by nature; when she made them, like fire, expansible over all space, without lessening their density, in any point; and like the air in which we breathe, move, and have our physical being, incapable of confinement, or exclusive appropriation. inventions then cannot in

UNIVERSITY LIBRARY

nature be a subject of property, society may give ~~an exclusive right~~ to the profits arising from ~~this~~ as an encouragement to men to pursue ideas which may produce utility. but this may, or may not be done, according to the will and convenience of the society, without claim or complaint from any body. accordingly it is a fact, as far as I am informed, that England was, until we copied her, the only country on earth which ever by a general law, gave a legal right to the exclusive use of an idea. in some other countries, it is sometimes done, in a great case, and by a special & <sup>sonal</sup> ~~permanant~~ act. but generally speaking, other nations have thought that these monopolies produce more embarrassment than advantage to society. and it may be observed that the nations which refuse monopolies of invention, are as fruitful as England in new and useful devices.

Considering the exclusive right to invention as given, not of natural right, but for the benefit of society, I know well the difficulty of drawing a line between the things which are worth to the publick the embratment of an exclusive patent, and those which are not. as a member of the Patent-board for several years, while the law authorised a board to grant or refuse patents, I saw with what slow progress a system of general rules could be matured. some however were established by that board. one of these was, that a machine, of which we were possessed, might be applied by every man to any use of which it is susceptible, and that this right ought not to be taken from him, and given to a monopolist, because he first perhaps had occasion so to apply it. thus a screw for crushing plaister might be employed for crushing corn-cobs. and a chain-pump for raising water might be used for raising wheat. this being merely a change of application. Another rule was that a change of material <sup>should not give</sup>, ~~gives~~ title to a patent. as the making a ploughshare of cast rather than of wrought iron; a comb of iron, instead of horn, or of ivory. or the connecting buckets by a band of leather, rather than of hemp or iron.

a third was that a mere change of form <sup>should</sup> give no right to a patent, as a high quartered shoe, instead of a low one, a round hat, instead of a three square, or a square bucket instead of a round one. but for this rule, all the changes of fashion in dress would have been under the tax of patentees. These were among the rules which the uniform decisions of the board had already established; and under each of them Mr Evans' patent would have been refused.

1. because it was a mere change of application of the chain pump, from raising water to raise wheat. 2. because the using a leathern, instead of a hempen band, was a mere change of material: and 3<sup>rd</sup> square buckets instead of round are only a change of form; and the ancient forms too appear to have been indefinitely square or round. but there were still abundance of cases which could not be brought under rule, until they should have presented themselves under all their aspects; and these investigations occupying more time of the members of the board than they could spare from higher duties, the whole was turned over to the judiciary, to be matured into a system, under which everyone might know when these actions were safe and lawful. instead of refusing a patent in the first instance, as the board was authorised to do, the patent now issues of course, subject to be declared void on such principles as should be established by the courts of law. this business however is but little analogous to their course of reading, since we might in vain turn over all the lumberly volumes of the law to find a single ray which would lighten the path of the mechanic or mathematician. it is more within the information of a board of academical professors, and a previous refusal of patent would better guard our citizens against harrassment by lawsuits. but England had given it to her judges, and the usual prudomancy of her examples carried it to ours.

It happened that I had myself a mill built, in the interval between Mr Evans's 1<sup>st</sup> and 2<sup>nd</sup> patents. I was living in Washington, and left the construction of the mill entirely to the millwright. I did not even know he had erected elevators, conveyors, and hopper-boys, until I learnt it by an application from

mr Evans's agent for the patent price. altho' I had no idea he had a right to it by law (for no judicial decision had then been given) yet I did not hesitate to remit to mr Evans the old and moderate patent price, which was what he then asked, from a wish to encourage even the useful revival of ancient inventions. but I then expressed my opinion of the law in a letter either to mr Evans, or to his agent.

I have thus, Sir, at your request, given you the facts & ideas which occur to me on this subject. I have done it without reserve, altho' I have not the pleasure of knowing you personally. in thus frankly committing myself to you, I trust you will feel it as a point of honor & candor, to make no use of my letter which might bring disquietude on myself. and particularly I should be unwilling to be brought into any difference with mr Evans whom however I believe too reasonable to take offence at an honest difference of opinion. I esteem him much, and sincerely wish him wealth & honor. I deem him a valuable citizen, of uncommon ingenuity & usefulness. and had I not esteemed still more the establishment of sound principles, I should now have been silent. if any of the matter I have offered can promote that object, I have no objection to it's being so used. if it offers nothing new, it will of course not be used at all. I have gone with some minuteness into the Mathematical history of the Elevator, because it belongs to a branch of science, in which, as I have before observed, it is not incumbent on lawyers to be learned; and it is possible therefore that some of the proofs I have quoted may have escaped on their former arguments. on the law of the ~~same~~ subject I should not have touched, because more familiar to those who have already discussed it; but I wished to state my own view of it merely in justification of myself; my name and approbation being subscribed to the act. with these explanations except the ~~same~~ -  
range of my respect.

The Jefferson
